

Junior Full-Stack developer in a fast growing start-up

Posted 7th of June 2018

At Flyhjælp ApS we are aiming to build the most advanced and automated workflow in the Flight Claim industry. While other companies in the industry are considering themselves service companies, we are a 100% a tech company. Consequently, we are now looking for new talents who can contribute to heightening an automated customer flow. Your focus area will be giving our customers the best possible service and results, and to technically ease our support and claim management departments. We have grown 100-400% a year over the past three years. We are present in 3 countries and have an international customers crowd, and we plan to keep up the growth and expand to even more countries in the future.

We are looking for developers who love to write beautiful and testable code, while working with the newest and best technologies within the field (i.e., Laravel, Vue, Nginx, Webpack, SCSS, MariaDB, Cypress). Someone who cares just as much for the user experience and usability for our customers as our in-house employees. Our in-house developed case-handling software, as well as our frontend, are ever-evolving products that are updated every week. Some of the latest implementations have been:

- An in-house developed signature software, allowing our customers to sign the power of attorneys directly on our website
- Automatic form submissions that allow our caseworkers to fill out tedious online forms with one click and see screenshots of the results
- Automatic generation of legal documents required for our growing body of lawsuits against airlines around the world, supporting multiple languages
- Creating our own API and connecting to lots of external APIs while building our own gateways

What we are looking for

We seek a junior developer, who will help us form the future of Flyhjælp's products along with the existing team of 3 other developers. We do not require that you to know the frameworks we use (Laravel, Vue, Tailwind), but you are expected to have a deep interest in learning new fields and have some basic familiarity with either Object Oriented PHP or JavaScript 2017. Knowledge of HTML5 and CSS3 is also advantageous. The most important part about you is that you aim to improve your skills, and on the long run you dream about being one of the best within your field. You know that this can only be achieved if you always update your knowledge, both with the training offered at the job as well as with your natural interest for the field, which makes you research new technologies and best practices just for your interest. You will report directly to the CTO.

What we offer

- A young start-up workplace in the heart of Copenhagen, Christianshavn
- Access to the best learning material, and a budget to buy new content related to programming in general or specifically to the technologies we use
- One yearly foreign trip to a coding conference and an annual domestic coding trip
- In-house training
- Social events throughout the year and a great lunch program
- A free coffee/espresso machine that brews whatever you like, free fruit and a great atmosphere
- State of the art work station (iMac, three 24-27 inch. monitors, excellent office view)

Please send your application to our CTO, Philip Brechmann at pb@flyhjaelp.dk.
